

USB memory sticks missing  
and company data in wrong hands?

**ENVAULT™**  
CORPORATION

# Keep your confidential data secure and your company off the headlines

Save money and nerves by preventing data leakages resulting from lost or stolen USB flash drives and USB hard drives.

**Envault™ USB Storage Protection** product turns your regular off-the-shelf USB storage devices into protected and remote-controlled "corporate devices" with a click of a button.

## Corporate-oriented data security

Automatic and centrally managed product enables you to expand and enforce your corporate data security policy to cover all use of portable USB storage devices.

USB storages turned into protected storages function just like before within the corporate intranet and in corporate workstations. Data can be taken outside the corporation, e.g. to customers, in a controlled way. Yet there is absolutely no unauthorized access to the data on the devices. You no longer need to worry about lost or stolen USB storages, or even those going out the door in ex-employees' pockets and purses.

You can therefore allow your employees the use of USB storages as powerful and handy tools, while still keeping your company confidential data secure and under control.

## Password-free means removed human error

As Envault Corp's groundbreaking automatic protection is always active and does not require any user interaction, passwords, complicated certificates or training, the human error is removed from your data security regarding USB storages. In other words, your company data security is no longer in the hands of employees, but defined by your IT administration and management.

## Effortless and quick deployment

Deploying the product is quick and easy, because your employees can conveniently protect all their existing USB drives as they use them.

The product includes a light client software. When any regular USB storage device is inserted to a workstation, the client offers to turn the device into a protected corporate device and to protect its contents. Optionally, the user can access the storage in read-only mode, enabling opening documents but preventing any writing.

# No more wild memory sticks

Your IT administration and employees can remotely control protected USB storages through a central management server's web browser interface in real time.

In addition, each file read and write event creates a mandatory log entry on the server, enabling you to see how and when USB storages are being used. The log enables also automatic usage statistics and reports. Even sudden mass copying of files can be tracked and stopped.

So take the initiative and easily and inexpensively protect the USB storages used in your company; the product costs only EUR 28–39 / workstation / year, depending on the order size.

The product is based on *envaulting*, a unique and patent-pending data protection method. Envaulting stores 99% of data in protected form to the USB storage and sends the remaining small part to a FragmentVault™ server in the corporate intranet.

From end-user viewpoint, a protected USB storage works just like any other USB storage – it does not even require a password. Client software can open automatically the protected files. But without access rights to the intranet and to the central server, the data on the USB storage is unreadable. For taking files outside the corporation, a protected USB storage has Airlock™ feature that can be accessed anywhere.

The product works in Windows XP® and Vista® environments, and supports all standard USB flash drives and USB/FireWire hard drives.

## Envaulting in a nutshell

In envaulting, a small piece of each protected file is taken to the central management server. Files can be accessed, when the user has rights to access the intranet. By locking the small pieces of files on the serverside, you can remotely disable/enable your USB storages in real time. Outside the intranet the USB storage can be used with Airlock™.
